RECYCLED STEEL

PROCESSED HIGH-TENSILE SPRING STEEL

Recovered from mattress spring units at our plant in Victoria. Shredded, separated by magnets, vibration, suction and an electrostatic fibre separator, then supplied loose or baled. One input, one product, one process.

MATERIAL	Processed high-tensile / high-carbon spring steel scrap, recovered from mattress spring units
FERROUS CONTENT	Approximately 99%
CONTAMINATION	Around 99% free of fabric, foam and other non-metal material after magnetic, vibration, suction and electrostatic separation
ORIGIN	Recovered and processed at the Recycle Group plant in Victoria, Australia
DOCUMENTATION	Load statement per dispatch: source stream, process, weighed output, bale count, container number

PRODUCTION	6–10 t per day, year-round
AVAILABILITY	Typically 130–250 t per month
FORM	Loose (bulk) or baled; bale dimensions vary with the press cycle, confirmed per order
SUPPLY	Road or rail within Australia; containerised at our plant for export (≈25 t of bales per 40-ft box, nominal)
SAMPLES	On request, before any commercial commitment

LOOSE PROCESSED SPRING STEEL (RENDERED)

BALED FOR HANDLING AND EXPORT (RENDERED)

THE PROCESS

1. **Shred.** Twin-shaft shredders break the mattress down to steel, foam, fibre and fabric.
2. **Magnetic separation.** Three magnets pull the ferrous fraction from the shredded stream.
3. **Vibration and suction.** Vibrating decks and high-volume suction strip fabric and foam; dust extraction keeps the air clean.
4. **Electrostatic separation.** An electrostatic fibre separator removes the last light fibre.
5. **Check and bale.** Inspected, then loaded loose or pressed into bales. Every bale counted before dispatch.

WHAT WE DO NOT CLAIM

We do not currently provide independent laboratory testing, chemical composition analysis, moisture testing or certified bulk-density figures. Buyers are welcome to run their own assessment on a supplied sample.
