THE DIFFERENCE IT MADE

CO_2-E AVOIDED

389 t

By putting **228 t** of recovered metal back into production instead of making it new — the carbon **6,490** trees absorb over ten years.

HOW THESE FIGURES ARE WORKED OUT

1. **Weighed in.** Every load crosses the weighbridge at North Geelong; the docket weight is the figure used.
2. **Turned into.** The load is processed on the line for its metal — the product it becomes is recorded against the load.
3. **Recovered.** The saleable metal weighed out. Where an output weight was not recorded, The Metal Recycling Company's usual recovery rate for that metal is used and the load is marked as an estimate.
4. **Saving.** Tonnes recovered × the published recycling credit for that metal — the carbon avoided by not making the same metal new from ore, net of collection and reprocessing (steel 1.5 t CO_2/t, worldsteel; copper 5.2, aluminium 7.9 and mixed metals 4.8 t CO_2-e/t, US EPA WARM). Metal in landfill does not break down, so no landfill methane is claimed.
5. **Trees.** CO_2-e avoided ÷ 0.060 t, what one tree seedling absorbs over ten years (US EPA).
6. Factors marked as stand-ins (brass, stainless) and usual recovery rates should be read as estimates.
